Alyogyne huegelii

Alyogyne huegeliiï is a flowering plant found in theï Southwest botanical provinceï ofï Western Australia, extending along its entire coastline.
A large flowered shrub, the species favours the sands of coastal shrublands and heath. The large flower, highly variable in colour, is similar to that ofï Hibiscus.ï Shrub to four metres with manyï alternateï branches, although lower ones may be sparse. Bright green leaves are divided in three to five in outline; margins are irregular, lobate to toothed; pubescent and strongly veined lobes are coarse in shape. Theï flower stalkï at the leafï axilï is long, tilting at the single flower.ï A large number of variants in the species have been cultivated, the colours of white, cream, purple. lilac, mauve, and the somewhat erroneous blue are traded asï varietiesï orï cultivars.

Category: Flowering shrubs
Families: Malvaceae
Genus: Alyogine
Species: huegelii
Geographical Area of Origin: Oceania
Climatic Zones: Sub-tropical, USDA 10 b (Southern Italy and islands)
Habit: Shrub-climber
Leaves: Evergreen
Colore Foglie: Verde
Flowering Period: Giugno / Luglio / Agosto / Settembre / Ottobre / Novembre
Flower: Simple flower
Colore Fiori: Viola
Favorite soil: Neutral / Middle-Dough / Medium soil
Water needs: Medium
Light Exposure: Medium shade / Half shade / Full light / Full sun
Form: Wired on stick / Plant on cane / Grown as shrub / bush

Colore Frutti: Marrone
