Starry wild jasmine

Jasminum multipartitum, is a species ofï jasmine, in the familyï Oleaceae, that is native toï Mozambique,ï Zimbabwe,ï Swazilandï andï South Africa.ï This scrambling climber can be grown in the sun or semi-shade. It produces masses of white, scented, star-shaped flowers.
Strongly branched from the base and with a dense and compact appearance, it bears small elliptical dark green leaves that form the background of a generous flowering between the end of spring and the beginning of summer (June-August). The latter is made up of large pure white flowers that are intensely perfumed and whose corolla can also present 12 petals. The buds, on the other hand, are characteristically dyed red and just as decorative.
Although it tolerates full sun, it prefers and develops better in conditions of partial shade. It needs rich and fertile, perfectly drained soils. It tolerates drought, but takes advantage of occasional summer irrigations; he regularly likes the addition of abundant organic material. After flowering it can be pruned to contain its growth or improve its compact shape. In addition to the open field, the plant gives excellent results in containers and is highly decorative even in the months in which it is free of flowers.

Category: Flowering shrubs
Families: Oleaceae
Genus: Jasminum
Species: multipartitum
Geographical Area of Origin: South Africa
Climatic Zones: Sub-tropical, USDA 10 b (Southern Italy and islands)
Habit: Shrub-climber
Leaves: Evergreen
Colore Foglie: Verde
Flowering Period: Maggio / Giugno / Luglio / Agosto
Flower: Tubular
Colore Fiori: Bianco ï Rosa
Favorite soil: Sub-acid / medium acid / Middle-Dough / Medium soil

Water needs: Medium
Light Exposure: Medium shade / Half shade / Full light / Full sun
Form: Wired on stick / Plant on cane / Grown as shrub / bush
Colore Frutti: Marrone
Parfumed: yes
